

RNI All Films 5 for Adobe Lightroom / ACR

—

Usage Tips

Foreword (sort of)

There is no right or wrong way to process images. Every choice of workflow is right as long as it delivers the look that suits your creative vision.

So please kindly consider all the tips & tricks below to be for your information only. They are not “musts”, and there is certainly more than one way of using this amazing product for your commercial projects or personal creative expression.

Presets or Profiles?

After installing RNI All Films 5 you may find it in your Lightroom's Presets panel as well as in the Profile Browser.

Which way should you use it?
Presets or profiles?

Use either way. It's really up to you. However the Presets panel is the way we would recommend.

Because this way gives you access to the grainy versions of some film stocks as well as to the RNI Toolkit, which allows for more editing flexibility.

Which Grain is Right?

In the Adobe world the grain is currently calculated in relation to a single image pixel not the overall image size. For that reason it is not currently possible to create an accurate “one size fits all” 35 mm grain simulation working equally well across various sensor sizes and cropping situations.

What works well for Canon EOS R users will be too much for Leica M9 and too little for Fuji GFX 100 or Hasselblad X1DII.

For that reason our grain comes as a separate tool (within RNI Toolkit) in three different sizes for each ISO value in addition to the generic “grainy” versions of each film stock developed for 22–36 MP sensors.

Also some additional tweaks of grain parameters may be required to suit the one’s vision or cropping situation.

White Balance

Just try to get it right in camera.

Using a neutral grey card or colour passport can be quite helpful.

Post Processing

In order to achieve the most genuine film look, we would recommend to treat the output of All Film 5 as if it was the output of your film scanner. And apply all the correction steps you would normally apply to a film scan.

To start with, try exporting your image, processed with RNI All Films 5, to Photoshop and apply Auto Levels (Cmd + L) or Auto Color (Cmd + Shift + B).

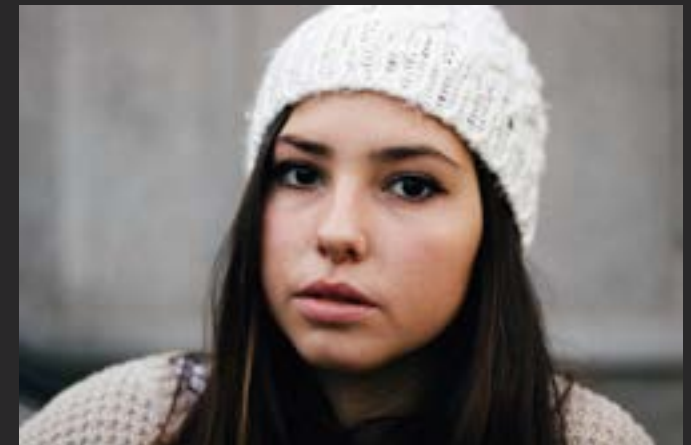

This will give you an initial idea of the correction stage most of film photos undergo in print or after being digitised.
